

## Psychological benefits of networking technologies in children's experience of ensemble music making

Journal:	<i>International Journal of Music Education</i>
Manuscript ID	IJME-RS-17-0004.R2
Manuscript Type:	Original Article
Keywords:	Engagement, ensemble music, motivation, orchestra, psychology, technology
Abstract:	<p>Little is currently known about the possible benefits of using networked technology to enhance ensemble performance. This study explored whether the introduction of specially devised technology – networked tablets using traditional music notation – to a primary school orchestra would enhance the experience of ensemble music. Particular emphasis was placed on how the technology could help children to overcome practical problems associated with ensemble playing for early stage musicians (e.g., keeping in sync with other players), thereby leading to better engagement with the music and ultimately greater enjoyment. Findings from a thematic analysis of responses from a focus group with 8 young orchestra players aged 9-11 years and from an interview with the orchestra conductor, together with indications from the statistical analysis of 28 orchestra participants' questionnaire responses, suggest that the technology did help to reduce the practical problems associated with ensemble playing. This appeared to interrupt the downward spiral of frustration and lack of confidence in playing for some young people, and enhanced the likelihood of feelings of enjoyment and belonging.</p>

**Psychological benefits of networking technologies in children’s experience of  
ensemble music making**

For Peer Review

**Abstract**

Little is currently known about the possible benefits of using networked technology to enhance ensemble performance. This study explored whether the introduction of specially devised technology – networked tablets using traditional music notation – to a primary school orchestra would enhance the experience of ensemble music. Particular emphasis was placed on how the technology could help children to overcome practical problems associated with ensemble playing for early stage musicians (e.g., keeping in sync with other players), thereby leading to better engagement with the music and ultimately greater enjoyment. Findings from a thematic analysis of responses from a focus group with 8 young orchestra players aged 9-11 years and from an interview with the orchestra conductor, together with indications from the statistical analysis of 28 orchestra participants' questionnaire responses, suggest that the technology did help to reduce the practical problems associated with ensemble playing. This appeared to interrupt the downward spiral of frustration and lack of confidence in playing for some young people, and enhanced the likelihood of feelings of enjoyment and belonging.

## Introduction

Ensemble music-making is a form of collaboration in which the participants actively contribute to a total musical effect larger than individual voices or instruments, through being in musical synchrony. In addition to aesthetic pleasure, the benefits of this activity include “self-confidence; social skills; a sense of belonging” (Hallam, 2010, p. 279). The benefits of ensemble playing are not limited to adult players; we know from existing research that participating in orchestral and ensemble performance of notated music repertoires has been found to confer multiple benefits amongst children and young people. Such benefits include communication skills, a sense of participation in a shared experience that can transcend language and cultural boundaries, critical-listening and self-correcting skills, raised self-confidence, and even empowerment after an experience of isolation (Kokotsaki & Hallam, 2007). Further, the musical and personal skills are transferable to other contexts, are attainable at an early age (Temmerman, 2005) and can influence later vocational outcomes (Abeles, 2004).

However, we also know that such positive experiences of ensemble music-making are not universally shared by children and young people because of varying degrees of musical literacy and opportunity in the population. Ensemble music making is a technically challenging abstract activity, one in which “counting is vital in order to keep time, at least to realise which beat is being performed and when to enter or exit” (Goodman, 2002, p. 153). This can be off-putting for beginners who may conclude incorrectly when they experience difficulties that they lack ability or aptitude, likely leading to loss of interest and motivation (Hallam, 1998), and potentially dropping out from the ensemble or even from music-making altogether. Indeed, in their study exploring the psychological mechanisms underpinning reasons for giving up a musical instrument in children, Evans, McPherson and Davidson (2013) found not only that a large number of children cease playing their instrument after just

1  
2  
3 a few years of playing, but also that a lack of perceived competence is a key reason for  
4  
5 children ceasing to play. Similarly, Hallam (1998) proposed that those who experience failure  
6  
7 are more likely to have reduced motivation and lose interest in their musical instrument.  
8

9  
10 Research shows that a wide range of factors play a role in children's persistence with  
11  
12 playing a musical instrument (e.g., Hartley & Porter, 2009; Hawkinson, 2015; Kinney, 2010),  
13  
14 and perceptions of musical ability appear to play a role in orchestral dropout for at least some  
15  
16 students (Cook, 2013). Given the high rates of drop-out from musical instrument learning, it  
17  
18 is not surprising that researchers have called for supportive and flexible teaching  
19  
20 environments which facilitate the development of creativity (Hallam, 2010). Further  
21  
22 recommendations for mitigating against drop-out come from Hallam and colleagues (2016),  
23  
24 who have highlighted the need for young learners to acquire "effective strategies" (p. 18) in  
25  
26 their practice in order to cope with the increasing demands of a repertoire that necessarily  
27  
28 becomes more difficult as a child learns. Moreover, they warn that self-beliefs and enjoyment  
29  
30 of performance may be impacted should this hurdle not be overcome, thereby increasing the  
31  
32 likelihood of drop-out.  
33  
34  
35  
36

### 37 *Psychological foundations for musical engagement*

38  
39 Longstanding psychological theories of motivation provide established frameworks  
40  
41 for understanding the mechanisms underpinning different motivational orientations to  
42  
43 musical engagement (for a review, see Hallam, 2002). We know, for example, that self-  
44  
45 efficacy – perceived capability – in a given domain predicts greater motivation and  
46  
47 persistence in that domain (Bandura, 1977; Schunk, 1995), while within self-determination  
48  
49 theory (SDT; Ryan & Deci, 2000) the psychological need of competence – related to the  
50  
51 experience of engaging in optimal challenges, feeling confident and effectual in tackling  
52  
53 challenges, and receiving encouraging feedback – has also been found to be associated with  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 task persistence and enjoyment across many domains (Grouzet, Vallerand, Thill, &  
4 Provencher, 2004; Ryan & Deci, 2000). Recently, Evans (2015) has demonstrated that these  
5 relationships hold for motivation to engage with music, and other studies have demonstrated  
6 associations between greater musical/instrument self-efficacy and motivation to play, as well  
7 as greater enjoyment of playing (Chandler, Chiarella, & Auria, 1987; Hallam et al., 2016;  
8 Martin, 2012). Furthermore, retrospective research conducted specifically to examine the  
9 fulfilment of the psychological needs of competence, alongside other basic needs for  
10 autonomy and relatedness that are outlined in SDT, showed that greater need fulfilment was  
11 associated with high engagement in a school music band. In contrast, reduced feelings of  
12 need satisfaction were associated with decisions to cease playing an instrument (Evans,  
13 McPherson, & Davidson, 2013).

Enjoyment is another well-established factor underpinning motivation, with research showing that enjoying musical activities is a strong predictor of future musical aspirations (Hallam, 2013). This again links to core psychological theories of motivation that help to unpick the importance of enjoyment for continued motivation and engagement. For example, using the SDT framework, the satisfaction of psychological needs within a particular domain has been shown to be associated with intrinsic motivation, which is defined as engaging in activities out of a genuine interest and enjoyment in them, rather than for external rewards (Ryan & Deci, 2000; Sheldon & Filak, 2008). Intrinsic motivation is in turn associated with greater persistence at a task and better performance (Deci & Ryan, 1991), as well as producing greater self-esteem and well-being (Ryan, Deci & Grolnick, 1995). Kokotsaki and Hallam's (2007) study of music university students' engagement in ensemble music making also highlights the importance of enjoyment. Furthermore, other research has indicated that children who develop a sense of intrinsic motivation early in the learning of their instrument achieve more highly on performance measures (Davidson & Burland, 2006; McPherson,

1  
2  
3 2008). Elsewhere, Hallam has emphasised the crucial role of enjoyment of musical pursuits if  
4 positive personal and social outcomes are to ensue: “the positive effects of engagement with  
5 music on personal and social development only occur if it is an enjoyable and rewarding  
6 experience” (Hallam, 2010, p. 269).  
7  
8  
9

10  
11 Finally, the importance of feelings of belonging, which has been defined as the  
12 subjective sense of being accepted, valued, included and being an important part of a group  
13 (Goodenow, 1993), is related to a further basic psychological need identified by SDT, namely  
14 relatedness. The extent to which children’s need for relatedness is satisfied in the classroom  
15 is a key predictor of academic motivation and performance (Furrer & Skinner, 2003;  
16 Goodenow, 1993), and there are also preliminary indications that a sense of belonging or  
17 relatedness may be one factor underpinning motivation for engaging in music ensembles  
18 (Kokotsaki & Hallam, 2007; Hallam, 2010).  
19  
20  
21  
22  
23  
24  
25  
26  
27

28  
29 In summary, research suggests that enjoyment, self-efficacy and belonging are key  
30 foundations for musical engagement. In turn, evidence on the benefits that accrue from  
31 participation in music-making (Kokotsaki & Hallam, 2007) suggests that this engagement  
32 further enhances these psychological characteristics, thereby creating a positive feedback  
33 loop.

#### 42 *Technologies for enhancing ensemble music motivation*

43

44 Many resources exist to encourage interest in ensemble music making. Figure Notes  
45 (n.d.) provides a paper and label based system for developing notation skills through a  
46 progressive approach from graphic notation to full musical notation. Charanga (n.d.) provides  
47 an extensive music teaching resource including a combination of digital support and  
48 materials to cultivate musical appreciation and performance in schools and has seen  
49 significant take-up. In 2014 the BBC started the Ten Pieces project, which now comprises  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 two films and bespoke resources for schools, with the aim of opening up “the world of  
4 classical music to a new generation of children” (BBC, n.d. a) through visually engaging  
5 performances of music ranging from Handel to Anna Meredith. The BBC supported this by  
6 commissioning lesson plans and arrangements with downloadable parts for mixed ability  
7 performance and made them freely available online (BBC, n.d. b).  
8  
9

10  
11  
12  
13 Furthermore, use of specially prepared paper parts and scores has been long  
14 established with publishers such as Chester Music (‘Kaleidoscope Easy Music for Varied  
15 Ensembles’ series, e.g., Elgar, 1998) and Wedgwood Music (n.d.) serving the school  
16 ensemble sector with paper based arrangements graded by ability level. However, even as a  
17 plethora of resources help to promote the value of ensemble/orchestral music-making and to  
18 demystify some of the obstacles regarding notation, there is a need to address directly the  
19 rhythmic and temporal coordination for polyphonic music with which children may struggle.  
20  
21

22  
23  
24  
25  
26  
27  
28 Frameworks for effective technology interventions to improve music learning  
29 experiences in schools have been considered for some years. Researchers have previously  
30 argued that in the right conditions digital tools can provide “a supportive environment for  
31 collaborative music-making” (Charissi & Rinta, 2014, p. 39). Core to Burnard’s critical work  
32 on reframing creativity and technology is the point that we should place two questions at the  
33 centre of new music technology and education projects: how pupils would like to work  
34 musically, and what resources they would like to use (Burnard, 2007, p. 38).  
35  
36  
37  
38  
39  
40  
41  
42  
43

44 In the context of developing tools to support harmonic function discrimination,  
45 Manzo (2014) noted that layers intervene between the student’s capability to understand the  
46 task and her/his ability to control an instrument. In a similar way, the student reading a  
47 musical part and trying to perform it in an ensemble setting can understand the task but as a  
48 beginner can experience latency in performing it due to the number of factors that have to be  
49 assimilated (reading notation, looking and listening for tempo coordination, fingering or  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 keying, bowing or blowing, looking ahead). Manzo argued that “by minimising the number  
4  
5 of layers between the student and the task, the musical concept can be isolated to some extent  
6  
7 and understood” (Manzo, 2014, p. 25).  
8

9 Existing software apps already address music notation in two ways: (a) training the  
10 user to achieve greater fluency in sight reading musical notation; (b) using music readers or  
11 digital music stands that enable the individual user to follow a digital version of the score  
12 during practice and performance. Type (a) includes apps such as Music Tutor (n.d.), designed  
13 to improve sight reading through randomised display of notes on a staff which the user is  
14 invited to identify. Type (b) includes apps such as Musicnotes Sheet Music Player  
15 (Musicnotes, n.d.), which will “preview, transpose, play and print sheet music and guitar  
16 tab”, and give access to a score library, from a desktop. Such software can certainly assist  
17 preparation for the experience of ensemble music making but they do not form a direct  
18 intervention into facilitating the experience of playing music in a group through a computing  
19 network. The current project aimed to address and to evaluate such a direct intervention using  
20 our technology solution to ensemble music coordination for beginners which involves  
21 synchronised part notation display to minimise layers (Manzo, 2014) and manage difficulty  
22 in a complex task for an individual in a group.

### 42 *The present study*

43 Building on core theoretical frameworks for understanding motivation, described  
44 above, we investigated the psychological benefits of using networked digital scores through  
45 the analysis of responses from primary school children taking part in a voluntary school  
46 orchestra club to survey-style questionnaires both before and after the introduction of the  
47 Networking Technologies and the Experience of Ensemble Music Making<sup>1</sup> (NETEM)  
48 system. A number of more specific strands of enquiry were established. First, while positive  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 responses on key variables relating to experiences of orchestra (e.g., self-efficacy, enjoyment  
4 and belonging) were expected due to the self-selecting nature of the group of young  
5  
6  
7 orchestral players who made up participants in this study, we wanted to investigate whether  
8  
9 there would be any overall changes from before to after the introduction of the NETEM  
10  
11 system. Second, and importantly, we recognised that there would likely be individual  
12  
13 differences in children's experiences of musical engagement, and therefore explored their  
14  
15 perceptions of the NETEM system in relation to variations in their levels of self-efficacy  
16  
17 (perception of playing ability), and their enjoyment of the ensemble rehearsals. Third, given  
18  
19 previous work which has highlighted the importance of experiences of group membership for  
20  
21 motivation to sustain ensemble music playing (Kokotsaki & Hallam, 2007; Hallam, 2010),  
22  
23 we focused on how individual responses to technology related to children's sense of  
24  
25 belonging to the orchestra.  
26  
27

28  
29 As well as using quantitative analysis of ratings given in surveys, we investigated the  
30  
31 above issues using qualitative analysis of responses from a focus group with a sub-sample of  
32  
33 young orchestral players, as well as an individual interview with the orchestra director. Our  
34  
35 analysis involved an exploration of the accounts of the children's and teacher's experiences  
36  
37 of orchestra, their motivation for attending, what they enjoyed and least enjoyed, and what  
38  
39 difference the introduction of the NETEM system had made to their experience of ensemble  
40  
41 playing. In addition to gaining rich insights into the psychological issues raised above, we  
42  
43 aimed to understand the practical consequences of using the technology as compared to using  
44  
45 standard sheet music. Inductive thematic analysis was used to analyse the data in line with  
46  
47 Braun and Clarke's guidance (2006).  
48  
49

50  
51 Overall, the present study – funded by the UK's Arts and Humanities Research  
52  
53 Council (AHRC) – sought to address the hitherto unexplored potential of NETEM, a  
54  
55 computationally networked tablet display system to improve confidence in mixed ability  
56  
57  
58  
59  
60

1  
2  
3 ensemble music making. In particular, we investigated how young musicians and their  
4 conductor experience, perceive, and respond to the use of a networked notation and display  
5 system. To answer the research questions stated above, the following quantitative and  
6  
7 qualitative methodology was employed.  
8  
9  
10

## 11 12 13 **Methodology**

14  
15 This was an innovative interdisciplinary project employing mixed methods. An  
16 arts/computing practice-led research approach was taken, in which the team was led by a  
17  
18 composer and arranger of music for flexibly scored ensembles. Human-computer interaction  
19  
20 experts and programming experts led the development of the networked technology, while  
21  
22 developmental psychologists led the evaluation aspect of the work, which is the focus of this  
23  
24 article.  
25  
26  
27  
28  
29

### 30 *Development of technology and repertoire*

31  
32 The aim of our NETEM system was to help support mixed ability groups playing  
33  
34 music together through a portable, self-contained and wireless digital technology. Work  
35  
36 began on the NETEM project in September 2015. This initial period involved the  
37  
38 development of the software itself, a fundamental part of which was gaining feedback from  
39  
40 users wherein test screens of possible formats for the dynamic graphical user interface were  
41  
42 shown to users as it was prepared; feedback on interaction and display was continually  
43  
44 sought throughout the project.  
45  
46

47  
48 It should be noted that this field work was part of a broader programme of  
49  
50 development and testing of the technology<sup>2</sup>. Starting before the application for AHRC  
51  
52 funding and then continuing through the project period, the technology was also developed in  
53  
54 consultation with an ensemble of university music students, and an advisory group of  
55  
56  
57  
58  
59  
60

1  
2  
3 academics in cognate areas, and cultural leaders from a range of regional and national  
4 organisations interested in ensemble music-making and technology. This was designed to  
5 ground and shape the development of the technology in the key concerns, perceived needs,  
6 and aspirations of stakeholders with relevant expertise and experience.  
7  
8  
9

10  
11 By December 2015, a prototype wireless server/client system had been created which  
12 used tablets loaded with scores and individual parts (Authors, 2016). Two apps were written:  
13 a ‘conductor’ app is used to select which score is to be played and in turn signal the position  
14 in the score to the ‘player’ apps, which display parts on individual screens. Because of the  
15 technology used, the single conductor app can wirelessly control multiple player apps. To  
16 date, this has been successfully applied to a network of 16 tablets.  
17  
18  
19  
20  
21  
22  
23

24 By January 2016, a working system was established alongside an initial library of  
25 compositions and arrangements. The system is capable of responding to and is triggered by  
26 tap tempo (tap out the beats on the screen at the tempo you want for the first bar of music,  
27 and then the system starts). In response to user feedback, the team added functions to enable  
28 the music director to choose to let the system run by itself; pause and/or adjust the tempo  
29 during performance by intervening with a new tap tempo; and conduct ‘manually’ (beat time  
30 currently through tapping) throughout the performance.  
31  
32  
33  
34  
35  
36  
37  
38  
39  
40

#### 41 *Design*

42  
43 The study employed a mixed-methods approach in order to capture first-hand the  
44 children’s and music teacher’s experiences of using the NETEM system, and to evaluate the  
45 perceived impact on a range of factors understood to be important for ensemble music  
46 playing.  
47  
48  
49  
50

51 For the qualitative part, a focus group with a subsample of the young orchestra  
52 players was carried out to explore the children’s own perceptions, motivations, and  
53  
54  
55  
56  
57  
58  
59  
60

experiences of using the NETEM system during orchestra rehearsals. The subsample was selected on the basis of: the children's own enthusiasm for contributing their views; the conductor's guidance to ensure that the group included a mix of children in terms of age, gender, ability, and time with the orchestra; and practical considerations regarding availability at school at the scheduled time of the interview. An in-depth interview with the music teacher, who also conducted the orchestra, was carried out to gain their perspective on pupils' experiences of ensemble music playing and on the perceived impact of the NETEM system to support engagement in ensemble playing.

A repeated-measures quasi-experimental design was employed for the quantitative aspect of this research using quantitative measures at pre and post time points to capture change and to measure the potential impact of the NETEM system. The questionnaire measures were completed during two separate phases, each of six weeks' duration (see Figure 1). Phase 1 (P1) took place before the technology had been introduced and was intended to operate as a comparison to Phase 2 (P2). The same questionnaire items were used during each phase, with only minor adaptations in P2 to allow for additional questions relating directly to the introduced technology. Attempts were made to match the two phases in terms of the genre and ability level of the pieces played, with a new piece introduced at each phase.

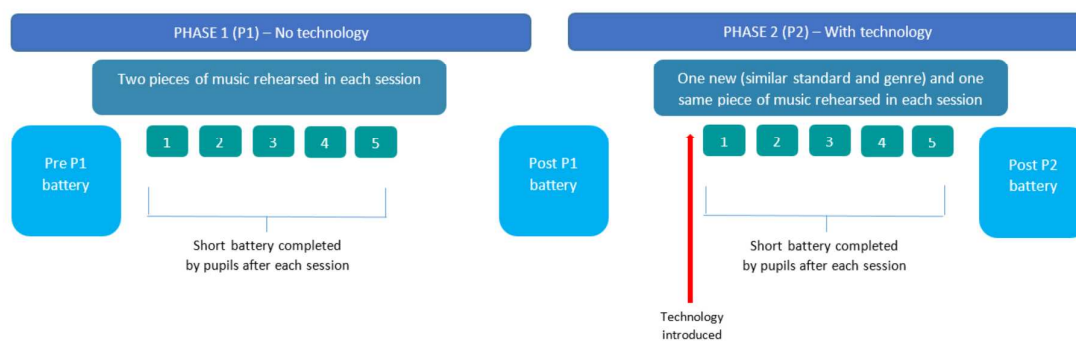

Figure 1: *Research design plan showing the two phases of research*

### *Participants*

Primary school pupils in East Sussex (N = 28)<sup>3</sup> in years 4, 5 and 6 (age range: 8 to 11 years; M = 9.25; 17 female, 11 male), taking part in a voluntary primary school orchestra club outside of normal school hours completed questionnaires. A subsample of pupils (N=8; mean age: 9.88; 6 female, 2 male) of mixed age, ability (1 to 5 years playing instrument), and orchestra experience (1 month to 1 year of orchestra involvement), took part in a focus group following the completion of data collection for the quantitative work. Furthermore, the orchestra conductor took part in an individual interview following completion of all questionnaire data collection.

### *Materials*

*Pre and post questionnaire measures.* Identical questionnaires were completed by children prior to the commencement of the first session in P1 (Pre-P1), following the final session in P1 (Post-P1), and following the final session in P2 (Post-P2). Items in this questionnaire tapped into children's sense of belonging to orchestra ("I feel like I belong to orchestra"); motivation to attend ("I want to go to orchestra, so I will always try to go"); feelings of being accepted at orchestra ("I feel welcome in orchestra"); and being an important part of orchestra ("I feel my playing helps orchestra sound good"). Questions also tapped into practical issues such as their ability to keep their place in the music ("I can easily keep my place in the music and not get lost"); and knowing when it is their turn to play ("I know when it is my turn to play"). Children indicated the extent of their agreement or disagreement with the above statements using a five-point rating scale with responses ranging from "not at all" (1) to "very much" (5). In order to arrive at a score of 'Overall Orchestra

1  
2  
3 Engagement', composite scores for the 8 items in this scale were calculated for each of the  
4 testing time points. Reliability analysis indicated good internal consistency (Cronbach's alpha  
5 at Pre-P1 = .77, Post-P1  $\alpha = .84$ , and Post-P2  $\alpha = .86$ )  
6  
7

8  
9 *Post session questionnaires.* In addition to questionnaires bookending each phase of  
10 data collection, children completed a brief questionnaire (again including quantitative ratings  
11 in response to listed questions) at the end of each orchestra rehearsal. This questionnaire  
12 tapped into the children's enjoyment of the orchestra rehearsal (3 items including: "How  
13 much did you enjoy orchestra today?"; reliability across all items and all sessions, P1-Enjoy  
14  $\alpha = .88$ ; P2-Enjoy  $\alpha = .87$ ), their sense of having improved and their perceived ability (3  
15 items including "How much do you feel you got better at playing the pieces today?";  
16 reliability across all items and all sessions, P1-Ability  $\alpha = .90$ ; P2-Ability  $\alpha = .89$ ), and in P2  
17 a question about the usefulness of the NETEM system was also asked ("How helpful were  
18 the iPads today?"). As before, participants answered the questions using a five-point rating  
19 scale with responses ranging from "not at all" (1) to "very much" (5).  
20

24  
25  
26  
27  
28  
29  
30  
31  
32

33 *Focus group topic guide.* Focus group questions tapped into the children's experience  
34 of orchestra including their reason for attending orchestra, activities during orchestra and  
35 what they enjoyed and found difficult about orchestra (see Appendix 1). Participants were  
36 also asked about their expectations and experiences of using the NETEM system introduced  
37 in P2.  
38  
39  
40  
41  
42  
43

44 *Teacher-interview topic guide.* Questions in the teacher-interview topic guide focused  
45 on the music teacher's (conductor's) perceptions of the young orchestral players' motivation  
46 for attending orchestra, the facilitators and barriers to engagement, and the teacher's own  
47 experience of using the introduced technology (see Appendix 2).

54  
55 *Procedure*  
56  
57  
58  
59  
60

1  
2  
3           Following study approval by the relevant internal institutional ethics committee,  
4  
5 informed school head teacher consent for the survey data collection was sought, followed by  
6  
7 parental permission via an information sheet and opt-out form. Once gatekeeper permissions  
8  
9 had been gained, the survey study was explained to the young players and their informed  
10  
11 consent sought. The children were then invited to complete the surveys during time set aside  
12  
13 either at the beginning or the end (depending on the questionnaire type) of orchestra sessions.  
14  
15 Prior to beginning the surveys, pupils were reminded that there were no right or wrong  
16  
17 answers to the survey questions and that they could skip over any questions they did not want  
18  
19 to answer, or stop altogether without giving a reason. School staff were present while the  
20  
21 children completed the surveys, providing support with comprehension difficulties where  
22  
23 required. Following completion of the surveys, there was an opportunity for pupils to ask any  
24  
25 questions they had.  
26  
27

28           Separate informed parental consent was sought from the parents of the subsample of  
29  
30 children taking part in the focus group. The focus group took place in an empty school  
31  
32 classroom following an orchestra performance to the school assembly a few weeks after P2  
33  
34 of the research had been completed. The focus group lasted 32 minutes and was recorded  
35  
36 using a digital voice recorder. Participating children were fully informed of the purpose and  
37  
38 nature of the focus group, both verbally and via an information sheet, prior to its  
39  
40 commencement. Participants gave written consent for the focus group to be audio recorded  
41  
42 and were made aware that they could choose to end their participation at any time, for any  
43  
44 reason, and that they could choose not to answer particular questions. The children were also  
45  
46 assured that the content of their non-anonymised responses would not be shared with  
47  
48 orchestra staff or players, unless they shared something that indicated a risk to themselves or  
49  
50 others. No payment was given for taking part.

1  
2  
3 Finally, the interview with the orchestra conductor followed ethical guidelines with  
4 informed consent gained prior to the interview's commencement. The interview took place in  
5 the school hall a few weeks after P2 of the research had been completed. The interview was  
6 audio recorded and lasted 15 minutes. The focus group and interview recordings were  
7 transcribed and then analysed by the first author following the recommended procedures set  
8 out by Braun and Clark (2006). The initial codes and final themes and sub-themes were then  
9 the subject of extensive discussions with co-authors to ensure they accurately represented the  
10 views expressed by the orchestra players and the conductor.

## 22 **Findings and discussion**

23  
24 The findings from this mixed methods research study are presented below utilising  
25 both the qualitative and quantitative results. We use excerpts from the focus group with  
26 pupils and the conductor interview to illustrate the major themes and subthemes emerging  
27 from the qualitative data, together with the results of analysis of relevant quantitative data.  
28 For the latter, a repeated measures ANOVA was carried out to investigate general trends in  
29 the children's experiences of orchestra, while partial correlations were calculated to shed  
30 light on individual differences in terms of experiences of orchestra involvement and whether  
31 those differences were predictive of outcomes<sup>4</sup>. The quantitative results should be treated  
32 with caution as preliminary indications, given that the sample size for analyses across the  
33 various time points of survey data collection ranged from 13 (for comparing scores across all  
34 three time points) to 24 (for tests of scores within a single rehearsal), as a result of differences  
35 in the number of children able to attend each orchestra session. The small sample sizes  
36 restrict our statistical power to detect patterns of change or association that exist in the data,  
37 especially where these are small, but the significant results reported below do provide a

1  
2  
3 meaningful starting point for understanding patterns of individual differences in children's  
4  
5 experience of orchestra and particularly using NETEM.  
6

7  
8 *Enjoyment of, and engagement in, orchestra*  
9

10 First, analysis of the focus group with children and of the teacher interview, together  
11  
12 with the results of the quantitative analysis, suggest that in general the children's experience  
13  
14 of orchestra involvement was positive from the very beginning of the study, and that this  
15  
16 continued for its duration. The children who took part in the focus group were unequivocal  
17  
18 about their enjoyment of orchestra and how much they valued the opportunity to play in an  
19  
20 ensemble setting. When asked why they took part in orchestra one child simply said: 'It  
21  
22 makes me feel happy', while others elaborated by describing their enjoyment at being able to  
23  
24 play their instrument within a group setting:  
25  
26

27  
28 When I play with other people I like the way that it all fits together, and it just makes  
29  
30 me feel like: Oh, we're all playing together and I like it.  
31

32 I started learning the violin since I was five, and for about four years I've been  
33  
34 playing alone but when I joined orchestra it just sounded so different and I felt a lot  
35  
36 happier than playing by myself.  
37

38 Here the children's emphasis is on their particular enjoyment of the musical product of  
39  
40 playing together. The sound is "so different" to when they have practiced alone and the  
41  
42 experience of their part fitting in with the sound of the orchestra is clearly a satisfying one.  
43  
44 The enjoyment of playing with others and the collective sound produced in orchestral playing  
45  
46 that the children describe mirrors the genuine interest and enjoyment that characterise  
47  
48 intrinsic motivational orientations. This motivational orientation is recognised by the  
49  
50 conductor who describes the children's enjoyment of collective playing and the "big sound"  
51  
52 it produces as the primary reason for why the children take part in orchestra:  
53

54 I think for a lot of them it's just sheer love of music. I think it's the excitement of  
55  
56 being part of something and being able to perform and be part of this big sound.  
57  
58  
59  
60

1  
2  
3 Whereas some of them, their parts might actually be very simple, but they are very  
4 impressed with the collective sound that they make.  
5

6 This positive experience of collective playing was also captured in the analysis of the  
7 quantitative data. Scores for Orchestra Engagement were high at each of the three time  
8 points, and although these tended to rise slightly from the beginning of the study to the end of  
9 the study, there were no significant differences across time (Pre-P1,  $M = 3.77$ ,  $SD = .60$ ;  
10 Post-P1,  $M = 3.95$ ,  $SD = .66$ ; and Post-P2,  $M = 4.03$ ,  $SD = .65$ ) as determined by a one-way  
11 repeated measures ANOVA,  $F(2, 24) = .705$ ,  $p = .504$ . Furthermore, when a pair-wise t-test  
12 was run specifically comparing aggregated session enjoyment scores taken during P1 (P1-  
13 Enjoy  $M = 4.34$ ,  $SD = .49$ ) to those taken during P2 (P2-Enjoy  $M = 4.36$ ,  $SD = .51$ ), no  
14 significant difference was found,  $t(16) = -.26$ ,  $p = .800$ . These ratings ranged from 3 (a little)  
15 to 5 (very much), with one-sample t-tests showing that ratings for enjoyment at each session  
16 in both phases were significantly above 3, all  $ps < .001$ . Thus, contrary to our expectations,  
17 levels of overall engagement – as reflected in questionnaire ratings – did not appear to change  
18 with the introduction of the NETEM system in P2.  
19  
20  
21  
22  
23  
24  
25  
26  
27  
28  
29  
30  
31  
32  
33

34 However, the questionnaire data did reveal important individual differences in  
35 enjoyment of the orchestra rehearsals. Interestingly, those who rated their rehearsal  
36 experiences most positively during P2 (P2-Enjoy) were those also showing most enjoyment  
37 during P1 (P1-Enjoy), even after controlling for perception of playing ability in P1 (P1-  
38 Ability),  $partial\ r = .64$ ,  $p = .007$ . Furthermore, greater enjoyment of orchestra rehearsals  
39 during P2 (P2-Enjoy) tended to predict greater Overall Orchestra Engagement at the end of  
40 P2, even after controlling for their overall perceptions at the end of P1, their perception of  
41 playing ability during P2 (P2-Ability), and their rating of how helpful the NETEM system  
42 was during P2,  $partial\ r = .683$ ,  $p = .029$ . These findings support previous research by  
43 Kokotsaki and Hallam (2007), which indicated that enjoyment of ensemble music playing is  
44 associated with greater motivation to engage further in musical activities.

### *Individual differences in response to the NETEM system*

Both the quantitative and qualitative data suggested that children's enjoyment and perceived ability during rehearsals related to their perceptions of how useful they found the technology and their enjoyment at P2. Correlational analysis showed that children who reported particularly high enjoyment of rehearsals during P1 (P1-Enjoy) perceived the NETEM system to be more helpful during P2, after controlling for ability at P1 (P1-Ability,  $M = 3.82$ ,  $SD = .82$ ) and Overall Orchestra Engagement at the end of P1 (Post-P1), *partial r* = .61,  $p = .047$ . Interestingly, this was not true for children who reported greater perceived ability in P1. In fact, there was a non-significant tendency for children who reported less perceived ability during P1 rehearsals (P1-Ability) to perceive the NETEM system as more helpful during P2, after controlling for enjoyment during P1 (P1-Enjoy) and their perception of orchestra overall at P1 (Post-P1), *partial r* = -.37,  $p = .263$ . Thus, the questionnaire data suggested that those who felt most positive about the helpfulness of the NETEM system were those who previously enjoyed orchestra, but did not necessarily believe their own ability to be very good.

Importantly, although ratings of the helpfulness of NETEM in P2 were generally high ( $M = 4.32$ ,  $SD = .66$ ), the children who rated NETEM most highly reported significantly more enjoyment of orchestra rehearsals during P2 (P2-enjoy), even when controlling for previous levels of rehearsal enjoyment during P1 (P1-enjoy), *partial r* = .55,  $p = .028$ . Thus, in line with Charissi and Rinta's (2014) comment that digital tools can create a supportive environment for children's collaboration in music in the right conditions, rehearsals were enjoyed more by those children who experienced NETEM as helpful. This pattern was evident in the focus group responses too. Children reported enjoying orchestra even more once the technology had been introduced, compared to without the NETEM system. When asked why they enjoyed orchestra more with the addition of the introduced technology, a

1  
2  
3 number of children pointed out that that the technology had helped them to overcome some  
4  
5 of the barriers they had previously experienced, such as losing their place in the music:  
6

7  
8 I think it's more fun with the iPads because it's easier and so... It's nice playing  
9 music and it's fun playing music, but not really when you lose your place, but you  
10 never lost your place with the iPads.  
11

12  
13 It's much better with the iPads because you won't get lost because it turns the page  
14 automatically and it helps the tune stick together, so it doesn't get people going with  
15 different parts, and then you'll just know where you're going so you won't have to  
16 worry about that too much.  
17

18 These extracts highlight how the introduction of the NETEM system could amplify the “fun”  
19 and enjoyment already experienced during orchestra by reducing or completely removing the  
20 distressing experience of losing one's place in the music. This in turn could enable some  
21 children to more fully engage in their part and orient themselves within the music as a whole,  
22 thus taking full advantage of the ensemble music making experience. The conductor also  
23 described how, by being able to follow their parts more consistently because of the NETEM  
24 system, many of the children had been able to engage more in collective playing, which she  
25 felt had added to their enjoyment of orchestra.  
26  
27  
28  
29  
30  
31  
32  
33  
34  
35

36 When they don't know the part and they don't know the rhythm, then we have to  
37 rehearse it far more before we can play it collectively. When the rhythm is being  
38 shown to them, they can join in far quicker.  
39

40 Together these findings reflect previous research which has shown that perceived  
41 competence in a given domain predicts greater motivation in that domain (Bandura, 1977;  
42 Schunk, 1995), as well as enjoyment (see Deci & Ryan, 2000; see Wang & Liu, 2007, for an  
43 example of this association in the domain of sport). Furthermore, Hallam and colleagues  
44 (2016), whose research showed a decline in motivation for early stage instrumental learners,  
45 have proposed that this decline in learners' motivation indicates the need for effective  
46 strategies to sustain self-belief and enjoyment. When it comes to the challenges of ensemble  
47 music making, the NETEM system may be one such strategy which can potentially help  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57

1  
2  
3 some children to increase their sense of instrumental competence and self-efficacy, and to  
4  
5 sustain, or even increase, their level of enjoyment in musical activities and their instrument.  
6

7 Certainly, the conductor felt that the introduction of the NETEM system had enabled  
8  
9 more children to remain within the orchestra where previously many would have dropped out  
10  
11 because they were struggling:  
12

13  
14 There are far more children that were struggling before that are now really able to take  
15 part with the iPads. [...] [The NETEM system is] useful for everybody, but for the less  
16 able it makes joining in accessible, whereas before, I think there's a few musicians  
17 there that are very new to it that might have struggled and then decided I think I'll  
18 stop and join again in a year. That does happen sometimes. [...] Because they need to  
19 be able to sight read and the iPads, from the teacher's point of view it's great because  
20 it's not deskilling them, it's not telling them the note, they've still got to read the  
21 music...  
22

23  
24 These comments from the conductor illustrate well how the NETEM system may have had a  
25  
26 particular role in scaffolding the orchestral playing for some children – particularly those  
27  
28 struggling to keep their place – enabling them to continue to benefit from playing in  
29  
30 orchestra. Moreover, this extract suggests that those children's psychological need to  
31  
32 experience competence in their environment, could potentially be met by the introduction of  
33  
34 the NETEM system, as an optimal level of challenge was reached which did not “deskill” the  
35  
36 child, but instead enabled them to continue to participate in a meaningful and enjoyable way.  
37  
38 The fact that the conductor perceived these benefits is encouraging, as it suggests that this  
39  
40 kind of technology could plausibly be integrated by instructors into routine practice in the  
41  
42 future (see Ifenthaler & Schweinbenz, 2013).  
43  
44  
45

#### 46 *Technology and children's sense of belonging*

47

48  
49 Besides the perceived impact reported by some of the children on their experience of  
50  
51 instrumental playing (e.g. sight-reading), our quantitative and qualitative results suggest that  
52  
53 NETEM may have enabled some children to sustain their involvement in orchestra and  
54  
55 therefore to have more experiences of group membership and belonging – factors which  
56  
57  
58  
59  
60

1  
2  
3 research indicates are likely to underpin motivation for engaging in music ensembles  
4  
5 (Kokotsaki & Hallam, 2007; Hallam, 2010). Our findings mirror these previous findings by  
6  
7 indicating that the children's enjoyment of orchestra is tied up with a social dimension. This  
8  
9 is clear from the responses from children in the focus group which revealed the high value  
10  
11 they placed on the opportunity that playing in orchestra gave them to be part of a group, to  
12  
13 develop new relationships with their peers, and ultimately to belong.  
14

15  
16 I think it really helps interact with other people as well. Because I've got this boy in  
17  
18 my class and I don't get on with him very well, but when we're in orchestra we can  
19  
20 just play together and just forget about everything.

21  
22 There's a boy in another class that I don't really know, and when I joined orchestra I  
23  
24 now know him and now we're in a band together, where before I wouldn't really  
25  
26 know him.

27  
28 In particular, these extracts highlight the children's experience of orchestra as a  
29  
30 transformative, liminoid space (Schechner, 2013), where new ways of being with one another  
31  
32 can be established and new friendships, as well as the possibility for new musical activities,  
33  
34 can be pursued. This inclusive community provides ample experiences of belonging and  
35  
36 acceptance, as the orchestra works as one entity combining efforts to produce together the  
37  
38 'big sound' the children so love.

39  
40 The analysis of survey data supports these findings with results indicating that higher  
41  
42 ratings of enjoyment of orchestra rehearsals during P2 (P2-Enjoy) predicted scores on a  
43  
44 specific item in the final questionnaire that tapped into sense of belonging ("I feel like I  
45  
46 belong to orchestra"), controlling for prior rehearsal enjoyment during P1 (P1-enjoy), *partial*  
47  
48  $r = .60, p = .019$ . As noted above, we cannot make definitive claims about NETEM having  
49  
50 overall benefits in increasing children's engagement with orchestra (which was high from the  
51  
52 start). However, our results have shown that at least some of the children reported particular  
53  
54 benefits from using NETEM, which in turn appeared to keep them positively engaged with  
55  
56 orchestra. Indeed, since higher ratings of enjoyment of orchestra during P2 (P2-Enjoy) were  
57  
58

1  
2  
3 predicted by perceptions of the NETEM system as being more helpful, as noted above,  
4  
5 engaging with the introduced technology could evidently have led some children to keep  
6  
7 playing in the ensemble and thereby experience more social engagement. As one child  
8  
9 expressed in simple terms:

11 When we got the iPads it just... I wanted to stay and carry on playing music.

13  
14 *Practicalities of engaging with NETEM system.*

16  
17 A great number of practical advantages to the introduced technology were cited by  
18  
19 both the children and conductor, corresponding to Manzo's (2014) observation that musical  
20  
21 development can be enhanced by removing some of the many layers between the musician  
22  
23 and the given musical task. The advantage most commonly mentioned by the children was  
24  
25 that playing music with the NETEM system meant that because their place in the music was  
26  
27 indicated via a highlighted bar, they were less likely to lose their place in the music – an  
28  
29 experience that had clearly been a frustrating and somewhat stressful experience beforehand:

31  
32  
33 I think it's easier with the iPads, because I used to lose my place all the time and I  
34  
35 used to think: Oh, hang on a minute, where am I? And I just used to lose it. But now  
36  
37 that we have the iPads, it's highlighted in green, and I think: Oh, well, I've lost my  
38  
39 place. Oh, here it is! Because I immediately can find it again.

40  
41 The experience of disorientation and lack of agency was palpable in such descriptions  
42  
43 from children of getting lost during orchestra rehearsals when they used paper music  
44  
45 notation. Interestingly, their descriptions of being able to find their place with the NETEM  
46  
47 system suggest greater experiences of control and agency: "I immediately can find [my place]  
48  
49 again". With the introduced technology, children who previously may have relied on  
50  
51 someone else pointing out where they should be in the music, could swiftly and  
52  
53 independently orient themselves and engage with the orchestra again. Existing theory and  
54  
55 research suggest that the experience of increased agency reported by children is likely to  
56  
57  
58  
59  
60

1  
2  
3 impact on feelings of competence and may also satisfy the psychological need of autonomy,  
4  
5 as outlined by SDT (Ryan & Deci, 2000).  
6

7 A further common problem that the children said had been overcome since using the  
8  
9 NETEM system was the fact that very often when they were using sheet music the paper  
10  
11 would fall off the stand whether because of a draft or a passing person. Although making  
12  
13 copies and using stand clips can of course help with this problem, our results show a clear  
14  
15 contrast between the experience of working with NETEM and the reality of paper-based  
16  
17 music rehearsals with an ensemble of young children. The children also talked about how the  
18  
19 nuisance of having to turn over a page of music whilst playing had been avoided since the  
20  
21 NETEM system had been introduced:  
22  
23

24 Well, sometimes it [turning the page] can be like a little bit of like a hassle. You have  
25 to like turn the page, and then play. Cause like if the piece was supposed to go duh,  
26 duh, duh, duh (sung ascending with a steady beat) and you would have to do duh,  
27 duh, [pause and mimes turning the page], duh, duh [laughter]. Cause like you would  
28 have to do something in the middle of the piece sometimes.  
29  
30

31 These issues were also recognised by the conductor, who identified the disruption caused by  
32  
33 these issues when using sheet music, and felt that using the NETEM system allowed these  
34  
35 challenges to be overcome, letting the children focus on the challenge of instrumental playing  
36  
37 in a group setting.  
38  
39

40 Indeed, both the conductor and children commented that since the introduction of the  
41  
42 NETEM system, synchrony within the orchestra had increased, allowing the conductor to  
43  
44 introduce more difficult pieces and the orchestra to successfully tackle those pieces with  
45  
46 confidence:  
47  
48

49 Conductor: The number of times we end up stopping [during rehearsals] because  
50 we're all not together are few and far between now. [The NETEM system] makes a  
51 big difference. [...] I think we'd still get there, but it would be much harder to get  
52 there, take much longer. So [the NETEM system] will definitely enable us to learn  
53 new pieces and more difficult pieces.  
54

55 Child: We've been doing a lot of different songs lately and ... we do a lot harder ones  
56 now we've got the iPads.  
57  
58

1  
2  
3 *Limitations and directions for future work*  
4

5           Despite the rich insights into young orchestral players' experiences of using the  
6 NETEM system, we cannot assume that these experiences would generalise to all young  
7 orchestral players using the NETEM system; indeed, the quantitative data clearly point to  
8 individual differences in experiences. Furthermore, whilst the longitudinal nature of this  
9 study gives some preliminary weight to possible causal interpretations, the small sample size  
10 means that caution should be observed when interpreting the results of the quantitative  
11 analysis of survey data. Additional longitudinal research with larger samples of ensemble  
12 musicians is now needed to systematically examine the extent to which the NETEM system  
13 can enhance the experience of ensemble performance and to test pathways between  
14 experiences of self-efficacy, agency, intrinsic motivation and belonging, which our results  
15 suggest may underpin positive outcomes.  
16  
17

18           In addition, a research design with multiple, well-matched ensembles that are  
19 randomly allocated to using NETEM or traditional systems (i.e., experimental and matched  
20 control groups) would be helpful for future evaluation of NETEM. With just one ensemble  
21 available for this preliminary development and evaluation work, we must acknowledge that  
22 any overall differences between the traditional and NETEM phases could be related in part to  
23 the greater experience and ability as well as to the inclusion of a new piece of music.  
24 However, this does not detract from the participants' direct comments on their experience of  
25 using NETEM, nor from the analysis of individual differences in their response to the  
26 NETEM system.  
27  
28

29           A further limitation of the present study is that our quantitative measures relied on  
30 children's self-report, which means that the possibility of shared method variance, informant  
31 bias, and socially desirable responding by participants cannot be ruled out. In order to  
32 increase validity, alternative measures should be included in future research, such as those  
33  
34  
35  
36  
37  
38  
39  
40  
41  
42  
43  
44  
45  
46  
47  
48  
49  
50  
51  
52  
53  
54  
55  
56  
57  
58  
59  
60

1  
2  
3 made through detailed observation methods. For example, video recordings of rehearsals can  
4  
5 be used to capture any changes in ensemble playing (e.g., participation of participants,  
6  
7 expressed frustration) before and after the introduction of the NETEM system.  
8

9  
10 Additionally, whilst Braun and Clark's (2006) procedures were followed in terms of  
11  
12 our analysis of the focus group and interview recordings, we did not have participants  
13  
14 complete member checks (Lincoln & Guba, 1985) to ensure accurate representation of their  
15  
16 views. Similar future research should include member checks in order to enhance rigor and  
17  
18 credibility. However, as the contributions of the children and orchestra conductor were very  
19  
20 concrete and self-explanatory, and required minimal interpretation, we do not think that the  
21  
22 internal validity has been threatened.  
23

24  
25 Additional factors related to children's ability to engage in ensemble music-making  
26  
27 (e.g., sight-reading ability; instrument grade/level; length of time in orchestra) would extend  
28  
29 our understanding of what existing individual differences explain the variance observed in  
30  
31 participants' responses over time, and how they interact with orchestra experiences and  
32  
33 perception of the usefulness of the technology introduced. It is likely that there are  
34  
35 constraints on the impact of the NETEM system for learner instrumentalists such that the  
36  
37 system is particularly salient at a certain stage in their learning and that the benefits of the  
38  
39 system may change beyond certain stages or cease altogether. These constraints must be  
40  
41 examined by systematically comparing ensemble groups of differing levels of skill and  
42  
43 experience in future research to determine what level of learner experience/skill is optimal for  
44  
45 the benefits of the system to be enjoyed.  
46  
47

48  
49 The way in which individual differences among musicians translate into a wide range  
50  
51 of outcomes should also be studied carefully. For example, we already know that individual  
52  
53 differences in achievement goal motivation are associated with different types of practice  
54  
55 behaviour (Miksza, 2010). Thus, future research could fruitfully focus on more elaborate  
56  
57  
58  
59  
60

1  
2  
3 analyses of individual differences in responses to technology such as NETEM, covering not  
4 only enjoyment of and persistence with ensemble music-making, but also individual musical  
5 development and practice behaviour. Moreover, all of these factors need to be considered  
6 within sociocultural context, given that, as well as school instructional approaches, family  
7 characteristics, socioeconomic status, gender, and culture are all likely to relate to children's  
8 expectations, beliefs, goals, values, and behaviours in the musical domain (see Hartley &  
9 Porter, 2009; Hawkinson, 2015; Kinney, 2010; McPherson & O'Neill, 2010).

10  
11  
12  
13  
14  
15  
16  
17  
18 Finally, the networked system was not without its own weaknesses in terms of  
19 usability and creativity (Authors, 2016). Future work should include more refined approaches  
20 to human-computer interaction and in particular the development of wireless tools for  
21 direction, and other strategies to enable conductors to lead the ensemble music experience  
22 hands-free and thus in a more expressive way than is currently possible. Further work should  
23 also refine the notation and display systems, including accessible settings to control the  
24 degree of scaffolding provided to musicians as they increase in confidence (e.g., how much  
25 signalling of position in the music is provided to ensemble players). The development of  
26 'augmented' notations can also be explored; this would build on standard notation but would  
27 make a range of wirelessly synchronised musical cues more widely accessible (for example  
28 colours and other graphics to indicate texture, dynamics and timbral changes). This would  
29 enable the affordances of contemporary tablet technology to be fully harnessed to the needs  
30 of contemporary music ensembles in a wide range of community settings – including its  
31 potential as a tool for inclusive music education for pupils with SEN (Burnard, 2007;  
32 Farrimond, Gillard, Bott, & Lonie, 2011; Kleiman, 2004) – thus contributing to Hallam's  
33 (2010) vision of a supportive and flexible environment capable of sustaining creativity and  
34 self-expression.

## Conclusion

In summary, findings from analysis of data from the qualitative and quantitative strands of work highlight how the NETEM system may have scaffolded some children's orchestral playing by reducing barriers to engagement, including keeping time and synchrony, thereby enhancing their enjoyment with orchestra and ultimately to more social engagement. Furthermore, this experience appeared to be especially true for those children who had previously enjoyed orchestra but also those children who had reported less perceived ability prior to the introduction of the NETEM system. As described above, we believe our results set an agenda for future research to build on these encouraging findings. Such research will be crucial if the potential of networked systems for enhancing access to and retaining the engagement of young people in ensemble playing is to be realised.

**Footnotes**

<sup>1</sup> For further information on the NETEM system visit [author website]

<sup>2</sup> Over the course of the funded project, NETEM was tested with primary and secondary school pupils, a professional classical chamber ensemble, an amateur contemporary music group, and an experimental rock group, to explore its usefulness in a range of settings. The ongoing development of the software through computer coding occurred in parallel with this testing, enabling technology to be developed in tandem with feedback from both adult and child users.

<sup>3</sup> Note that there was considerable variability in N from session to session depending on students' availability.

<sup>4</sup> The partial correlations tested whether differences in children's responses to questions at one time point (predictors) were statistically associated with subsequent responses to other questions (outcomes), after controlling for other variables that could potentially be playing a role (e.g., earlier scores on the outcome measures).

Topic Guide		
Theme	Research question	Actual question
Experience of orchestra	Reason for attending	Why do you play in orchestra? What makes you come to orchestra every week?
	Activities during orchestra	What kinds of things do you do at rehearsals?
	Enjoyment	What do you enjoy the most about playing in orchestra? Why? What is the best bit about orchestra? Why? Would you recommend playing in an orchestra to other young people? Why?
Experience of using NETEM during orchestra rehearsals	Difficulties	Is there anything you don't like about orchestra? Can you tell me about that? What's the most difficult thing about playing in orchestra? Is there anything that helps to make that better/less difficult?
	Expectations	How did you feel when you heard that you would be using iPads instead of sheet music?
	Experience	What has it been like to use the iPads? Do you prefer to play in orchestra with the iPads or without? Why? What is the best thing about using the iPads? What is the best thing about using sheet music on stands? How could the iPads be better?
	Perceived improvement	Do you think your playing during orchestra has changed since the iPads were introduced? If so, how has it changed?

Interview with music teacher/orchestra conductor		
Theme	Research question	Actual question
<b>Motivation</b>	Pupil motivation for taking part	What motivates pupils to take part? What brings them back week after week to each session?
	Pupil enjoyment/difficulties	What do they like best and least about the sessions?
<b>Engagement</b>	Pupil engagement (pre technology)	Prior to the introduction of the NETEM system did you find that pupils could join in and fully engage in the orchestra?
	Barriers to pupil engagement	What are the main challenges/barriers to participating fully in the orchestra for pupils? How were these barriers tackled or overcome prior to the introduction of the NETEM system?
<b>Experience of using NETEM technology</b>	Teacher and pupil expectations prior to introduction of technology	How did you feel about the technology being introduced? What were your hopes, fears, expectations? How do you think the pupils felt?
	Experience of technology	Can you tell me a bit about your experience of using the technology? How did it work?
	Benefits and difficulties of technology	What were the difficulties (if any)? What were the benefits (if any)? Can you tell me what difference, if any, the introduction of the technology has had on pupils' ability to join in and engage fully in orchestral playing?
